# Starting and exiting WebCTRL

To start a WebCTRL system:

- 1** Start the WebCTRL Server, called Core, to run the system database. See “Running the WebCTRL Server” on page 5.
- 2** Configure your Internet browser to correctly display WebCTRL. See “To configure your browser” on page 13.
- 3** Launch the WebCTRL system in the browser. See “To launch WebCTRL” on page 19.

The WebCTRL Server must be running the system database before you can launch the system in a browser.

Log out of the system to exit WebCTRL. You can shut down the WebCTRL Server at the same time, or let it continue to run. See “To log out” on page 21.

## Running the WebCTRL Server

Before you can view a WebCTRL system in a browser, you must first start the WebCTRL Server, called Core, to run the system database. The WebCTRL Server automatically runs the system database that is currently defined as the default database in SiteBuilder. See “To create a database” in the SiteBuilder manual.

On startup, the WebCTRL Server initializes and then minimizes to the taskbar. You must restore the WebCTRL Server (Core) dialog box to perform functions such as switching to a different system, restarting or shutting down.

“To switch between Normal and Design Modes” on page 9

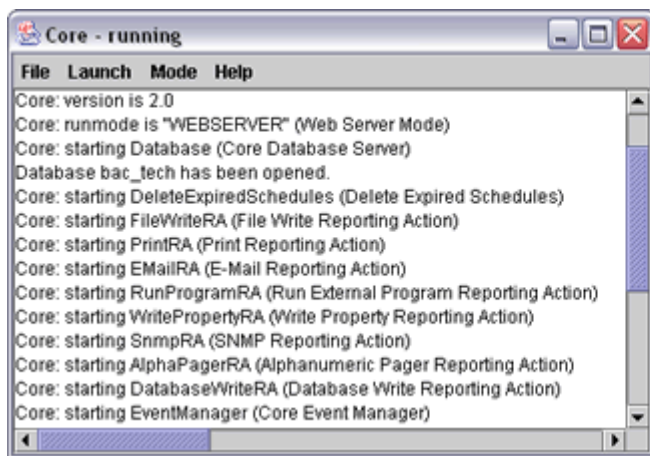

“To shut down the WebCTRL Server from the Core dialog box” on page 10

“To restart or shut down the WebCTRL Server using a manual command” on page 11

## To start the WebCTRL Server

Click Start > Programs > WebCTRL x.x > WebCTRL Server to start the WebCTRL Server, Core. Core initializes and then automatically minimizes to the taskbar.

**NOTE** If you use WebCTRL as a Windows service, your computer can automatically start Core every time the computer starts. For details, see "Running WebCTRL Server as a Windows Service" in the Install Server software manual.

## To start a different system

When you start the WebCTRL Server, called Core, it automatically begins running the system database defined as the default system database in Sitebuilder. See “To create a database” in the SiteBuilder manual. However, you can switch to a different system from Core.

- 1 Log out of WebCTRL if you are logged in.
- 2 Restore the minimized Core dialog box.
- 3 Click File > Exit.

- 4 Click Start Different System.

**5** Click the Select Database drop-down arrow, then click the system database that you want to run.

**6** Click OK. The server automatically restarts, then runs the new system's database.

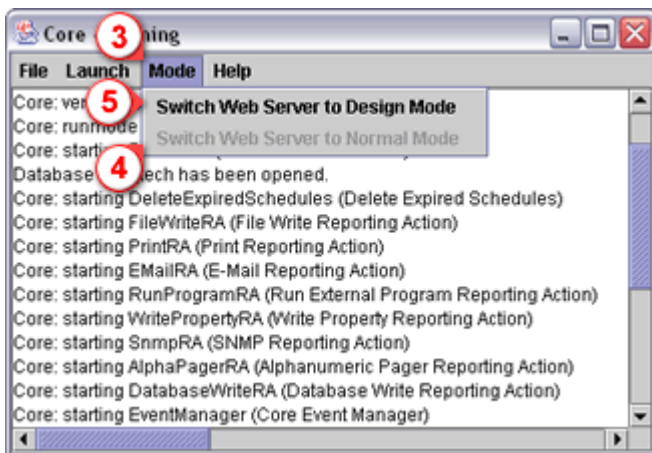

## To switch between Normal and Design Modes

Design Mode allows you to run WebCTRL without connecting to the control module network. Use this mode to verify links between graphics, to set up parameters, schedules, events, and trends prior to connecting to the system, or to configure the system connections settings.

To switch between Normal and Design Modes:

- 1** If the WebCTRL Server, Core, is not already running, click Start > Programs > WebCTRL x.x > WebCTRL Server.
- 2** Restore the minimized Core dialog box on your task bar.
- 3** Click Mode.
- 4** The option that is grayed out is the mode Core is currently running in.
- 5** Click the mode not grayed out to switch to that mode.

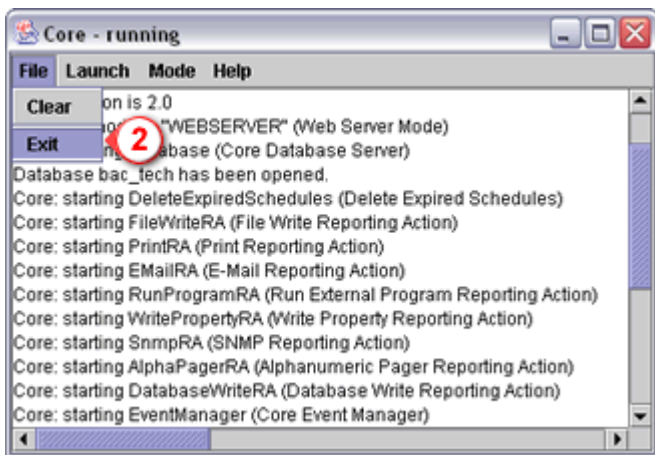

When you switch modes, Core restarts in the new mode.

**NOTE** You can also switch to design mode in SiteBuilder when running SiteBuilder concurrently with WebCTRL. See “To run SiteBuilder concurrently with WebCTRL” in the SiteBuilder manual.

## To shut down the WebCTRL Server from the Core dialog box

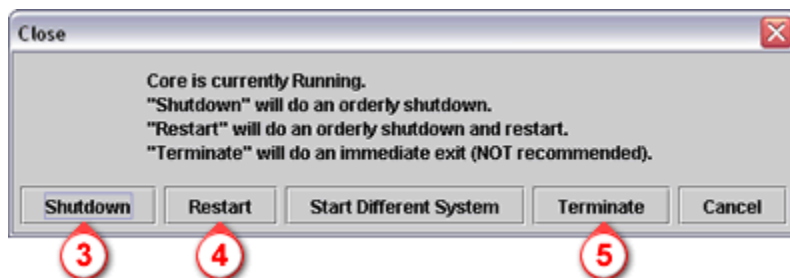

- 1 Log out of WebCTRL if you are logged in before you shut down the WebCTRL Server, Core.
- 2 Restore the minimized Core dialog box on your task bar, then click File > Exit.

- 3 Click Shutdown.

Other options are:

- 4 Click Restart for changes to settings in WebCTRL that require a restart to take effect.
- 5 Click Terminate as a "last resort" if Core does not shut down using the Shutdown command and the system appears to lock up. Terminate shuts down Core, but you may lose data.

**NOTE** You can also shut down or restart the WebCTRL Server from your browser using manual commands if you have the appropriate privileges.

## To restart or shut down the WebCTRL Server using a manual command

You must have the Manual Commands/Console Operations and System Shutdown privileges to execute the manual commands described below.

- 1 Click the WebCTRL menu button, then click Command.
- 2 Type `rebootserver` or `shutdown`, then click OK.

`rebootserver` - Restarts the WebCTRL Server. After WebCTRL executes the command, you are reminded to log back in to WebCTRL.

`shutdown` - shuts down the WebCTRL Server. After WebCTRL executes this command, there is no communication between the Server and a browser running WebCTRL, so any WebCTRL screens on the browser are left open.

**Related Topics:**

## To configure your browser

Configure your browser to display your WebCTRL system properly before using your browser to view the system.

- 1 Open the browser's Internet Options.

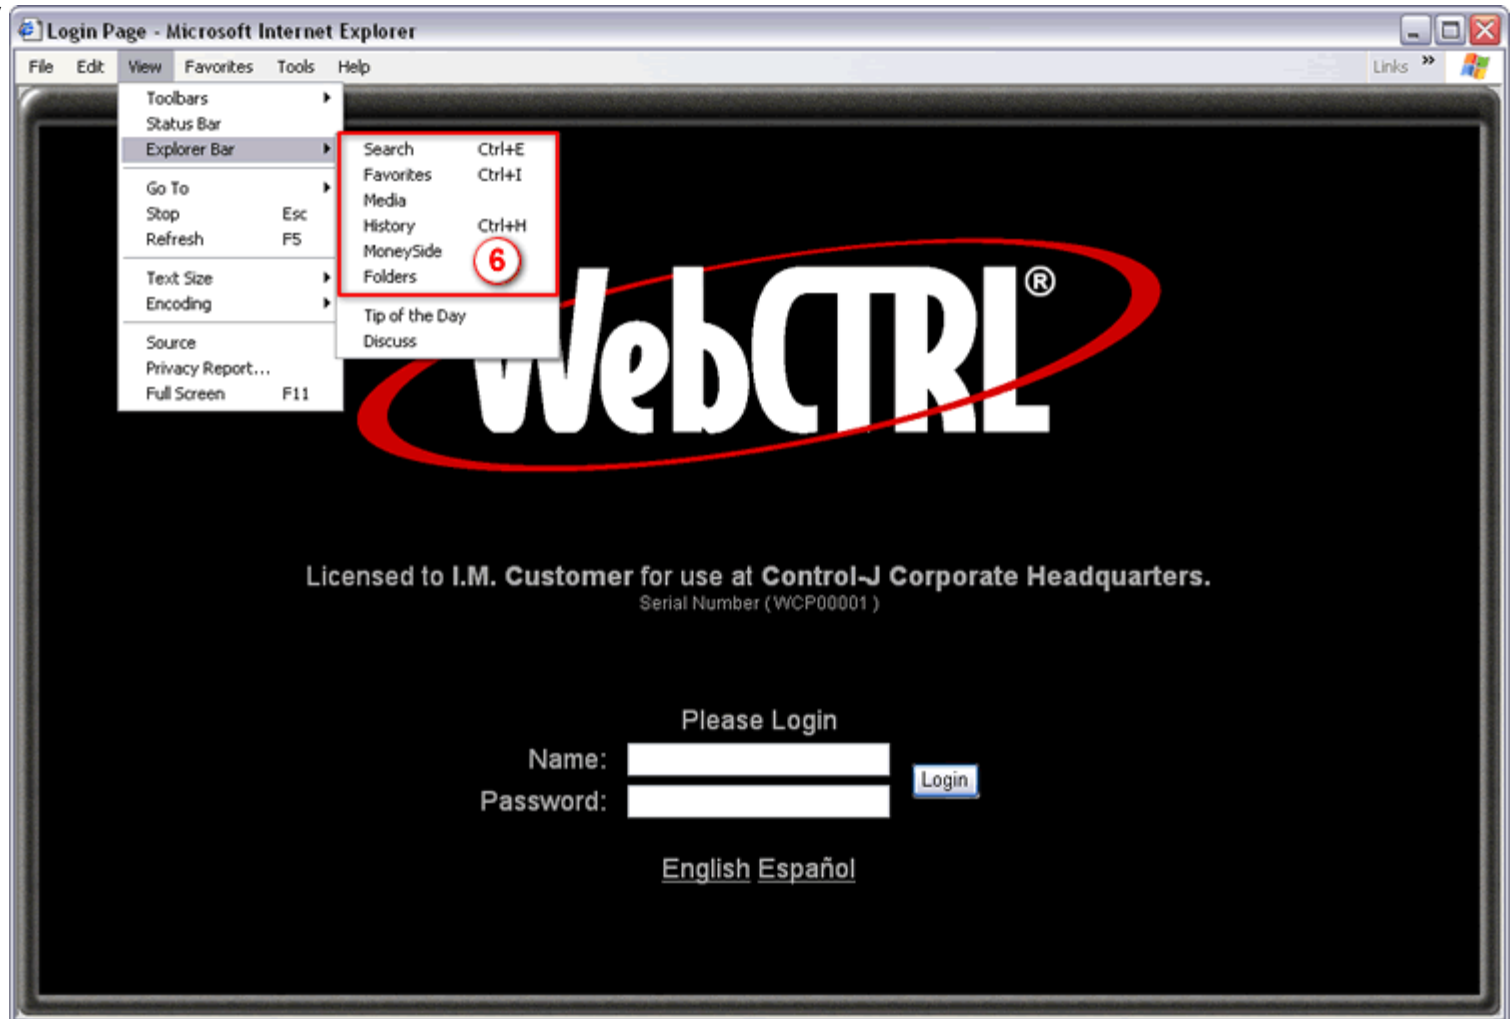

- 2 Set the browser to Automatically check for newer versions of stored pages
- 3 Disable the image toolbar.
- 4 If the computer is to be used by more than one system operator, disable the prompting to save passwords.

- 5 You should not use the browser's buttons to navigate through WebCTRL. Therefore, hide the browser's navigation buttons.

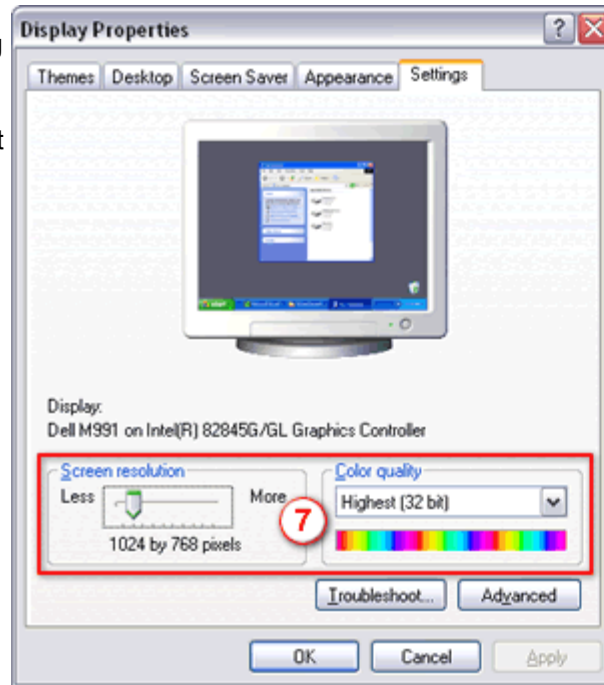

- 6 Hide the browser's Explorer Bar by disabling any options that display it.

**7** Set your monitor's screen resolution to an appropriate setting for the graphics in your system. 1024 x 768, high color quality (24 or 32-bit) is recommended for most systems.

**8** Maximize the browser's window.

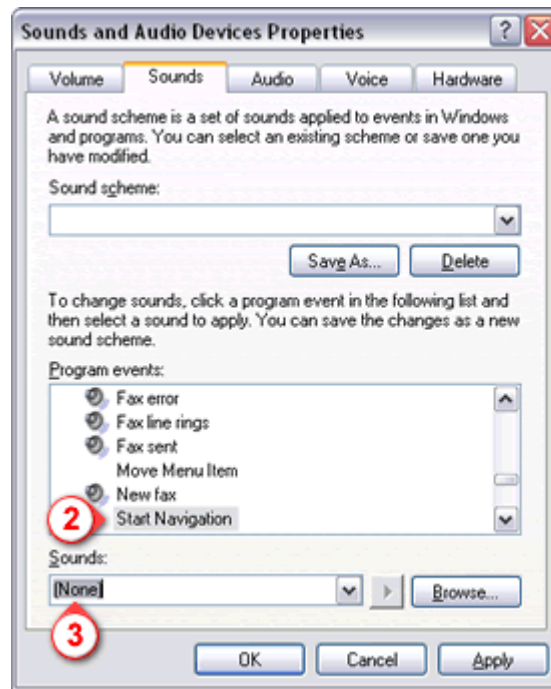

If you want to turn off the sounds your computer associates with the browser, see “To disable navigation sounds” on page 18.

## To disable navigation sounds

To turn off the sounds your computer makes as you navigate the browser:

- 1 Open the Sounds and Audio Properties in the Control Panel.
- 2 For the Start Navigation event,
- 3 set Sounds to None.

## To launch WebCTRL

**NOTE** The WebCTRL Server, Core, must be running the system database before you can launch WebCTRL. See “To start the WebCTRL Server” on page 6.

- 1 Open your Internet browser, then type your server’s computer name, domain name, or IP address in the Address bar.

For example:

`http://abccompany/`

or

`http://webctrl.acme.com`

or

`http://192.168.168.1/`

If you are running the browser on the same computer as Core, you can use

`http://localhost`

**NOTE** If you want to make the WebCTRL login page the default opening page for your browser, set it as the home page in the browser’s Internet Options.

To log in,

- 2 Type your user name in the **Name** field. This field is not case sensitive.
- 3 Type your password in the **Password** field. This field is case sensitive.
- 4 Click Login.

The WebCTRL Server authenticates the name and password, and then displays your default starting location in the WebCTRL system.

## To log out

To maintain security, we recommend that you log out of WebCTRL when you have finished with your current session.

To log out, click the WebCTRL menu button, then click the Logout menu command. WebCTRL logs you out of the system and returns to the Login screen.

**NOTE** Do not close the browser's window without logging out of WebCTRL. If you do, you are still logged in, taking up a licensed operator slot. This could prevent additional operators from logging in.

**NOTE** You can be automatically logged out of WebCTRL. If automatic logoff is enabled on the System Settings page and the server does not detect any user activity for a specified period of time, you are automatically logged out when that time period expires. The period of time can be the default time period defined on the System Settings page or it can be a time period defined for each operator on the Operators page.
